Sno.	Department	Title	Description	Link
1	Biochemistry	DIGITAL PH METER CALIBRATION	pH meter, electric device used to measure hydrogen-ion activity (acidity or alkalinity) in solution. Fundamentally, a pH meter consists of a voltmeter attached to a pH-responsive electrode and a reference (unvarying) electrode. The pH-responsive electrode is usually glass, and the reference is usually a silver-silver chloride electrode, although a mercury-mercurous chloride (calomel) electrode is sometimes used. When the two electrodes are immersed in a solution, they act as a battery. The glass electrode develops an electric potential (charge) that is directly related to the hydrogen-ion activity in the solution (59.2 millivolts per pH unit at 25 °C [77 °F]), and the voltmeter measures the potential difference between the glass and reference electrodes.	
2	Biochemistry	HANDS ON - PHOTOCOLORIMETER	A colorimeter is a device that is used in Colorimetry. It refers to a device which helps specific solutions to absorb a particular wavelength of light. The colorimeter is usually used to measure the concentration of a known solute in a given solution with the help of the Beer-Lambert law. It is used in laboratories and hospitals to estimate biochemical samples such as urine, cerebrospinal fluid, plasma, serum, etc. It is used in the manufacturing of paints. It is used in textile and food industry. It is used in the quantitative analysis of proteins, glucose, and other biochemical compounds. It is used to test water quality. It is used to determine the concentration of haemoglobin in the blood.	
3	Conservative Dentistry and Endodontics	Operator Positioning for Cavity Preparation Along With Finger Rest and Body Posture	"There are 4 different types of chair position in dentistry Right front (7 o'clock), Direct right (9 o'clock), Right rear (11 o'clock) and Direct rear (12 o'clock) position. Right front position - used for treating mandibular anterior teeth, mandibular right posterior teeth and maxillary anterior teeth. Direct right position- used for treating facial surface of maxillary and mandibular right posterior teeth. Right rear position- most commonly used position as it helps in providing good access to most areas of oral cavity. Direct rear position- used for working on lingual surface of mandibular anterior teeth. Good cavity preparation requires correct operator positioning and proper handling of mouth mirror as mouth mirrors apart from providing indirect vision also provides good amount cheek retraction. Operator positioning not only helps in cavity preparation but helps in maintaining a proper body posture, increased comfort, lack of pain and reduced stress levels."	
4	Conservative Dentistry and Endodontics	Demonstration of obturation using thermoplasticized injectable gutta percha system with Calamus system	The primary goal of endodontic treatment is to achieve thorough debridement of the root canal system followed by achieving a fluid tight apical seal with the help of 3-dimensional (3D) obturation. It is imperative to achieve 3D obturation including filling of the lateral and accessory canals in order to achieve best results. While research has identified the setbacks in traditional techniques, alternate techniques and systems are being recommended to achieve treatment goals. The calamus system is a thermoplasticized injectable gutta percha system which helps to achieve a 3D fluid-tight apical seal. This video describes the various parts and elaborates the procedure to use the calamus system for obturation. The video also highlights its ergonomically designed hand piece which has a 360 degree activation cuff which provides a smooth, continuous expression of gutta-percha, obturating the lateral or accessory canals thereby preventing microleakage and treatment failure. The demonstration on extracted teeth allows for better visualization and orientation to operator in order to utilize the system in clinical situations.

Sno.	Department	Title	Description	Link
1	Biochemistry	Beta oxidation	Beta oxidation is a process in which fatty acids are broken down to be used to produce energy	
2	Biochemistry	Biosynthesis of cholesterol	Cholesterol is a key component of cell membranes and is an essential component of cell membranes and is an essential precursor for steroid hormone	
3	Biochemistry	Carbohydrates	Carbohydrates are responsible for storing chemical energy in living organisms and important constituent for supporting tissues in plants	
4	Biochemistry	Carbohydrate metabolism	Carbohydrate metabolism is a key aspect of health and optimal function in a variety of species, a primary alteration in major global diseases such as cardiovascular diseases and diabetes	
5	Biochemistry	Diabetes and cardiovascular diseases	People with diabetes are more likely to have other conditions that raise the risk for heart disease	
6	Biochemistry	Enzymes	Enzymes are essential for respiration, digesting food, muscle and nerve function	
7	Biochemistry	Fat Soluble Vitamins	Vitamins are nutrients that body needs in small amount to work properly and stay healthy	
8	Biochemistry	Free radical injury and antioxidants	Oxidative stress is an imbalance between free radicals and antioxidants in body	
9	Biochemistry	Liver function test	Liver function tests are blood tests used to help diagnose and monitor liver disease or damage

B.D.S. Supply & Main Examination,
May-2018

**CONSERVATIVE DENTISTRY
INCLUDING ENDODONTICS**
(BDS-012)

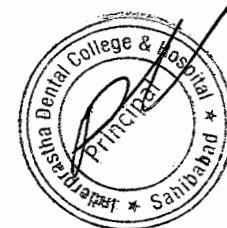

Time : Three Hours] [Maximum Marks : 70

Note : Attempt all questions. Use separate copy for
Part-I and Part-II.

Part-I

1. Discuss importance of isolation of operating field.
What are different methods of isolation? 10
2. Discuss G. V. Blacks classification of caries. How
will you manage class 2 dental caries with silver
amalgam? 10
3. Write short notes on :
(a) GIC (glass ionomer cement) 5
(b) Casting defects 5
(c) Non carious lesions. 5
